## IN THE CLAIMS

1. (original) A method for producing a fused polypeptide comprising the steps of:

(a) immobilizing a first polypeptide or portion thereof fused to a first intein fragment on a solid support;

- (b) immobilizing a second polypeptide or portion thereof fused to a second intein fragment on a solid support wherein said second intein fragment is complementary to said first intein fragment; and
- (c) reacting said first and second immobilized polypeptides under conditions which favor transplicing of said first and second polypeptide to produce a fused polypeptide comprising said first and second polypeptides.
- 2. (original) The method of claim 1, further comprising the step of eluting the fused polypeptide from the solid support.
- 3. (original) The method of claim 1, wherein said first and second polypeptides are selected from the group consisting of peptides, proteins and enzymes.
- 4. (original) The method of claim 1, wherein said solid support is selected from the group consisting of affinity based supports, chips, plates, biochip supports, glass wafers and microtiter plates.
